

TESTOSTERONE

TESTOSTERONE CYPIONATE (GRAPE SEED OIL) 5mL, 10mL

Short Description: Testosterone is a hormone that is important for the development and maintenance of male sexual characteristics, muscle mass, and male fat distribution.

Long Description: Testosterone is a hormone that is important for the development and maintenance of male sexual characteristics, muscle mass, and male fat distribution. Testosterone is used to treat multiple conditions, including low testosterone levels in men (known as hypogonadism), to improve libido, bone density, muscle mass, body composition, mood, erythropoiesis, and cognition. Testosterone cypionate is delivered by injection into the muscle or subcutaneous fat as a cypionate ester. The cypionate ester has a half-life of around 7 days. This ester is cleaved by esterases in the blood, yielding pure bioidentical testosterone. This preparation is compounded with grape seed oil instead of the cottonseed oil typically used in commercial preparations, allowing for a less viscous solution and faster injections. Many older men have a medical condition called hypogonadism and need testosterone replacement therapy (TRT). It is important to note that testosterone cypionate is a prescription medication and should only be used under the supervision of a healthcare provider.

TESTOSTERONE CYPIONATE (SESAME SEED OIL) 5mL, 10mL

Short Description: Testosterone is a hormone that is important for the development and maintenance of male sexual characteristics, muscle mass, and male fat distribution.

Long Description: Testosterone is a hormone that is important for the development and maintenance of male sexual characteristics, muscle mass, and male fat distribution. Testosterone is used to treat multiple conditions, including low testosterone levels in men (known as hypogonadism), to improve libido, bone density, muscle mass, body composition, mood, erythropoiesis, and cognition. Testosterone cypionate is delivered by injection into the muscle or subcutaneous fat as a cypionate ester. The cypionate ester has a half-life of around 7 days. This ester is cleaved by esterases in the blood, yielding pure bioidentical testosterone. This preparation is compounded with sesame seed oil instead of the cottonseed oil typically used in commercial preparations, allowing for a less viscous solution and faster injections. It is important to note that testosterone cypionate is a prescription medication and should only be used under the supervision of a healthcare provider.

TESTOSTERONE CYP/PROP (GRAPE SEED OIL) 5mL, 10mL

Short Description: Testosterone is a hormone that is important for the development and maintenance of male sexual characteristics, muscle mass, and male fat distribution.

Long Description: Testosterone is a hormone that is important for the development and maintenance of male sexual characteristics, muscle mass, and male fat distribution. Testosterone is used to treat multiple conditions, including low testosterone levels in men (known as hypogonadism), to improve libido, bone density, muscle mass, body composition, mood, erythropoiesis, and cognition. This special compounded medication combines long-acting cypionate ester with short acting propionate ester, providing a faster acting preparation with more stable blood levels. Testosterone cypionate and propionate are delivered by injection into the muscle or subcutaneous fat as an ester. This ester is cleaved by esterases in the blood, yielding pure bioidentical testosterone. Testosterone is a hormone that is important for the development and maintenance of male sexual characteristics, muscle mass, and male fat distribution. This preparation is compounded with grape seed oil instead of cottonseed oil typically used in commercial preparations, allowing for faster injections. It is important to note that testosterone cypionate is a prescription medication and should only be used under the supervision of a healthcare provider.

TESTOSTERONE PROPIONATE (GRAPE SEED OIL) 10mL

Short Description: Testosterone is a hormone that is important for the development and maintenance of male sexual characteristics, muscle mass, and male fat distribution.

Long Description: Testosterone is a hormone that is important for the development and maintenance of male sexual characteristics, muscle mass, and male fat distribution. Testosterone is used to treat multiple conditions, including low testosterone levels in men (known as hypogonadism), to improve libido, bone density, muscle mass, body composition, mood, erythropoiesis, and cognition. Testosterone propionate is delivered by injection into the muscle or subcutaneous fat as a propionate ester. The propionate ester has a half-life of around 3 days. This ester is cleaved by esterases in the blood, yielding pure bioidentical testosterone. This preparation is compounded with grape seed oil instead of cottonseed oil typically used in commercial preparations, allowing for faster injections. It is important to note that testosterone propionate is a prescription medication and should only be used under the supervision of a healthcare provider.

TESTOSTERONE ENANTHATE 5mL, 10mL

Short Description: Testosterone is a hormone that is important for the development and maintenance of male sexual characteristics, muscle mass, and male fat distribution.

Long Description: Testosterone is a hormone that is important for the development and maintenance of male sexual characteristics, muscle mass, and male fat distribution. Testosterone is used to treat multiple conditions, including low testosterone levels in men (known as hypogonadism), to improve libido, bone density, muscle mass, body composition, mood, erythropoiesis, and cognition. Testosterone enanthate is delivered by injection into the muscle or subcutaneous fat as a enanthate ester. The enanthate ester has a half-life of around 5 days. This ester is cleaved by esterases in the blood, yielding pure bioidentical testosterone. This preparation is compounded with grape seed oil instead of cottonseed oil typically used in commercial preparations, allowing for faster injections. It is important to note that testosterone enanthate is a prescription medication and should only be used under the supervision of a healthcare provider.

NANDROLONE DECANOATE 5mL, 10 mL

Short Description: Nandrolone Decanoate is prescribed for anemia, osteoporosis, chronic kidney disease, inoperable breast cancer, enhancing muscle strength, and stimulating red blood cell formation.

Long Description: Nandrolone decanoate, known by the brand name Deca-Durabolin, is a 19-demethylated derivative of testosterone that is produced in low amounts (almost undetectable) naturally in the human body. Belonging to a group of medications known as anabolic steroids, they are prescribed to treat a number of conditions in men and women. Alternative agents like Nandrolone are often prescribed instead of testosterone in order to take clinical advantage of their enhanced anabolic effects. For example, Nandrolone possesses around 300% of the anabolic activity (building of lean tissue, fat loss) of an equivalent dose of testosterone, all the while carrying only around 30% of the androgenic activity (male sex characteristics). Additionally, Nandrolone has been used by clinicians with substantial success to treat joint pain and provide relief in settings where dangerous and addictive painkillers would have otherwise been used. It is important to note that nandrolone decanoate is a prescription medication and should only be used under the supervision of a healthcare provider.

TESTOSTERONE CYPIONATE (WESTWARD) 10mL

Short Description: Testosterone is a hormone that is important for the development and

maintenance of male sexual characteristics, muscle mass, and male fat distribution.

Long Description: Testosterone is a hormone that is important for the development and maintenance of male sexual characteristics, muscle mass, and male fat distribution. Testosterone is used to treat multiple conditions, including low testosterone levels in men (known as hypogonadism), to improve libido, bone density, muscle mass, body composition, mood, erythropoiesis, and cognition. Testosterone cypionate is delivered by injection into the muscle or subcutaneous fat as a cypionate ester. The cypionate ester has a half-life of around 7 days. This ester is cleaved by esterases in the blood, yielding pure bioidentical testosterone. This preparation is manufactured by a commercial manufacturer. It is important to note that testosterone cypionate is a prescription medication and should only be used under the supervision of a healthcare provider.

TESTOSTERONE ENANTHATE (WESTWARD) 5mL

Short Description: Testosterone Enanthate is used to treat low testosterone levels in men, aiding in libido, bone density, muscle mass, mood, and cognitive functions.

Long Description: Testosterone is a hormone that is important for the development and maintenance of male sexual characteristics, muscle mass, and male fat distribution. Testosterone is used to treat multiple conditions, including low testosterone levels in men (known as hypogonadism), to improve libido, bone density, muscle mass, body composition, mood, erythropoiesis, and cognition. Testosterone enanthate is delivered by injection into the muscle or subcutaneous fat as a enanthate ester. The enanthate ester has a half-life of around 5 days. This ester is cleaved by esterases in the blood, yielding pure bioidentical testosterone. This preparation is manufactured by a commercial manufacturer. It is important to note that testosterone enanthate is a prescription medication and should only be used under the supervision of a healthcare provider.

DEPO TESTOSTERONE (PFIZER) 1mL, 10mL

Short Description: Depo-Testosterone is used for testosterone replacement in males with deficiency, treating specific breast cancers, aiding masculinization, and potentially reducing anxiety and social distress.

Long Description: Testosterone is a hormone that is important for the development and maintenance of male sexual characteristics, muscle mass, and male fat distribution. Testosterone is used to treat multiple conditions, including low testosterone

levels in men (known as hypogonadism), to improve libido, bone density, muscle mass, body composition, mood, erythropoiesis, and cognition. Testosterone cypionate is delivered by injection into the muscle or subcutaneous fat as a cypionate ester. The cypionate ester has a half-life of around 7 days. This ester is cleaved by esterases in the blood, yielding pure bioidentical testosterone. This preparation is made by Pfizer and known by its brand-name Depo-Testosterone. Many older men have a medical condition called hypogonadism and need testosterone replacement therapy (TRT). It is important to note that testosterone cypionate is a prescription medication and should only be used under the supervision of a healthcare provider.

TESTOSTERONE TOPICAL (COMPOUNDED)

Short Description: Testosterone topical treats low testosterone in adult males, improving libido, muscle mass, mood, bone density, and energy levels with convenient daily application.

Long Description: Topical testosterone is a form of testosterone that is compounded into a cream for application to the skin daily for replacement of testosterone in deficient individuals. Topical testosterone is well tolerated and one of the most common types of testosterone in the United States. These creams can be compounded with any additional hormone that is needed by the patient. Our topical testosterone products are available in alcohol and non-alcohol based gels, creams, and solutions.

TESTOSTERONE SUBLINGUAL

Short Description: Testosterone sublingual therapy boosts circulating testosterone levels almost immediately, enhancing libido, mood, muscle mass, and cognitive function in men with low levels.

Long Description: Sublingual testosterone is an orally administered testosterone that is very short acting and is typically used prior to sexual activity to enhance libido. For patients that are deficient in testosterone related to increasing age, or clinical reason; this may help increase sex drive. This is an advantage to patients that have issues with injections or have preferences for an oral option for testosterone products.

PEPTIDES

SERMORELIN

Short Description: Sermorelin promotes natural growth hormone release, aiding in growth deficiencies, improving muscle mass, reducing fat, enhancing energy, and supporting overall well-being.

Long Description: Sermorelin is a peptide that differs from Ipamorelin in its amino acid chain that is used to stimulate the pituitary gland to increase the natural growth hormone levels in deficient individuals. As we get older, growth hormone production decreases, and therefore IGF-1, its active agent, decreases as well. The IGF-1 hormone primarily is responsible for the positive body changes seen with HGH, accelerated healing, increased collagen production as well as increased energy and turnover. Sermorelin is effective in increasing your body's natural production of growth hormone to optimal levels.

OXYTOCIN

Short Description: Oxytocin enhances emotional bonding, reduces stress and anxiety, may help with libido, and may improve social interactions and mood disorders.

Long Description: Oxytocin is the primary hormone related to bonding between humans. This increases when we hug someone or are in love with them. These levels are decreased as we get older, and this can lead to a decreased attachment/ satisfaction with your partner as we get older. Replacement of this hormone can increase overall health, wellness, and increase sexual satisfaction with your partner along with increasing daily happiness levels.

PT-141 BREMELANOTIDE

Short Description: PT-141 Bremelanotide enhances sexual desire and function in both genders, improves mood, may aid in bladder control, and strengthens pelvic floor muscles.

Long Description: PT-141, or Bremelanotide (Brand name Vyleesi), is a peptide medication approved by the FDA to treat HSDD (Hypoactive sexual desire disorder) in premenopausal women. The medication is given by injection into the subcutaneous fat on the stomach an hour or two prior to sexual activity. It is also effective when given as a nasal spray, but absorption is substantially limited by this route. It was given

breakthrough therapy status by the FDA and fast tracked for its approval. Unrivaled in its effectiveness, Bremelanotide is quickly becoming the go to medication for sexual dysfunction in females. As an added benefit, tanning of the skin is induced by administration of Bremelanotide, giving it the nickname of “The Barbie Drug”.

WELLNESS (Oral)

7 KETO DHEA

Short Description: 7-Keto DHEA boosts metabolism, supports weight loss, enhances memory, strengthens the immune system, reduces signs of aging, and increases muscle mass.

Long Description: 7-Keto-DHEA (also known as 7-oxodehydroepiandrosterone) is a byproduct of the hormone dehydroepiandrosterone (DHEA). It is produced naturally in the body, but can also be taken as a dietary supplement. 7-Keto-DHEA is not converted to testosterone or estrogen in the body and therefore does not have the same effects as those hormones. Some people take 7-Keto-DHEA as a supplement to try to boost metabolism, promote weight loss, improve memory, reduce inflammation, and enhance immune function.

DHEA

Short Description: DHEA supports sexual function, improves bone density, decreases body fat, enhances mood and skin health, and may reduce aging effects and depression.

Long Description: DHEA is a natural hormone, sometimes called the “master hormone”, made in the adrenal glands that is implicated in the healthy functioning of the immune system and as a precursor to male and female hormones. In the body, DHEA is converted by enzymes into intermediate hormones like androstenedione and androstenediol before conversion to estrogens (female sex hormone) and androgens (male sex hormone). DHEA levels in the body begin to decrease after age 30, decreasing more quickly in women than in men. DHEA levels appear to be lower in people with depression and after menopause. DHEA cannot be obtained from food. DHEA is available in the form of tablets, sublingual drops, and topical creams.

PREGNENOLONE

Short Description: Pregnenolone may improve memory, mood, energy levels, and immune function, reduce inflammation, aid in stress management, and enhance sleep quality and duration.

Long Description: Pregnenolone is known as the mother of all hormones as its downstream metabolites will convert from pregnenolone into estrogen, testosterone,

DHEA, important neurosteroids, and other hormones. Some of these hormones and metabolites are active throughout the body and the brain and are involved in concentration, mental clarity, and overall hormone support. Supplementing with pregnenolone may assist with levels of other hormones in deficiencies along with assisting in brain fog, energy, and mental clarity by increasing neurosteroid concentrations.

VITAMINS

VITAMIN D3 (COTTON SEED OIL)

Short Description: Vitamin D3 injections boost calcium absorption, enhance bone health, alleviate muscle weakness, improve immune function, and may prevent or treat vitamin D deficiency.

Long Description: Vitamin D3 injections are an easy way to increase serum levels of this essential hormone. Vitamin D plays a substantial role in the immune system, regulating the immune responses, overall health, and hormone production. Having deficiency in Vitamin D can lead to osteoporosis, low calcium levels, and changes in body composition, and depression. The symptoms of Vitamin D deficiency are too numerous to list in detail, so it is always best to have a blood test to check for a true deficiency before prescribing this medication.

METHYLCOBALAMIN (B12)

Short Description: Methylcobalamin (B12) injections help treat deficiencies, boost energy, improve brain function, enhance mood, speed metabolism, and support red blood cell production and nerve health.

Long Description: Methylcobalamin, a natural form of Vitamin B12, plays a crucial role in health and wellness improvement. It supports the maintenance of healthy nerve cells and is vital for DNA synthesis and repair, contributing to overall brain health. Additionally, it aids in the production of red blood cells, preventing megaloblastic anemia, and boosts energy levels by facilitating the conversion of carbohydrates into glucose. Its contribution to the methylation process also helps detoxify the body, enhancing immune function and mood regulation.

CYANOCOBALAMIN (B12)

Short Description: Cyanocobalamin (B12) injections are used to treat vitamin B12 deficiencies, supporting red blood cell formation, neurological function, and DNA synthesis.

Long Description: Cyanocobalamin is a type of B12 that is a widely available a treatment for B12 deficiency. Low levels of Vitamin B12 typically present with a constellation of symptoms, including: anemia, low energy, difficulty losing weight, changes to the hair or nails, and changes to red blood cell morphology. This compounded Cyanocobalamin injection is an effective treatment for correcting and

preventing deficiency in individuals who are at risk. Vitamin B12 (Cyanocobalamin) can also be effective when given in a dissolving sublingual tablet, oral tablet, or when injected.

HYDROXOCOBALAMIN (B12)

Short Description: Hydroxocobalamin (B12) injections treat and prevent B12 deficiency, aiding in red blood cell production, energy metabolism, nerve function, and potentially cyanide poisoning treatment.

Long Description: Hydroxocobalamin is a natural form of Vitamin B12 used for health and wellness improvement, particularly in treating B12 deficiency. It's administered to combat anemia by promoting the formation of red blood cells, thus enhancing oxygen transport and energy levels. Hydroxocobalamin also supports nerve cell health, aiding in the maintenance of neurological function and preventing neuropathy. Its role in detoxifying the body, especially in removing cyanide from the system, further underscores its importance in maintaining overall health.

BIOTIN (B7)

Short Description: Biotin (B7) injections support healthy hair, skin, and nails, enhance metabolism, improve glucose tolerance, and aid in fatty acid synthesis and nerve health.

Long Description: Biotin (B7) is a water-soluble vitamin that is essential in the formulation of elastin, in the body. It utilizes enzymes to help carry nutrients into the body's tissues. Transportation of nutrients can help increase body composition, increase hair growth, skin elasticity, along with increased overall nail health.

PYRIDOXINE (B6)

Short Description: Pyridoxine (B6) injections prevent and treat B6 deficiency, support brain health, alleviate pregnancy nausea, and may improve mood and reduce depression symptoms.

Long Description: Pyridoxine (B6) is a form of B vitamin that is essential for the conversion of food into energy for cells to utilize in the body and to metabolize amino acids. This B vitamin is essential for the proper function of nerves and the nervous system as a whole. In persons with deficiencies, they may have what are called neuropathies (tingling in the hands and feet). Typically, the deficiency can be corrected by supplementing with Vit. B6 to alleviate symptoms and prevent damage to the nerves.

DEXPANTHENOL (B5)

Short Description: Dexpanthenol (B5) injections aid in metabolic processes, skin health enhancement, wound healing acceleration, digestive system support, and energy production from fats, proteins, and carbohydrates.

Long Description: Dexpanthenol, a derivative of Vitamin B5 (Pantothenic Acid), plays a significant role in health and wellness by promoting the healing of skin wounds, reducing inflammation, and moisturizing the skin. It's beneficial for enhancing skin health, including strengthening hair follicles and improving nail quality. Additionally, dexpanthenol supports energy metabolism by aiding in the breakdown of fats and carbohydrates, contributing to overall vitality.

NIACINAMIDE (B3)

Short Description: Niacinamide (B3) support skin health, reduce inflammation, enhance brain function, improve cholesterol levels, and potentially protect against certain skin cancers.

Long Description: Niacinamide (Vit. B3) is a B vitamin essential to prevent and treat pellagra. It is useful in treating acne and in persons with inflammatory skin conditions. Niacinamide increases skin thickness, collagen production along with decreasing cortisol levels as well. This form can be taken orally or topically. Topical formulations of this are used for skin ailments such as acne, and sunburn. This formulation is compounded in the form of an injection IV, IM, or SC injection.

RIBOFLAVIN (B2)

Short Description: Riboflavin (B2) aid in energy production, improve skin and eye health, prevent migraines, and support the body's antioxidant defense system.

Long Description: Riboflavin, or Vitamin B2, is pivotal for health and wellness, primarily through its involvement in energy production. It aids in the conversion of carbohydrates into ATP, the fuel the body runs on. Riboflavin also plays a critical role in maintaining healthy skin and mucous membranes, enhancing eye health, and preventing oxidative stress by acting as an antioxidant. Its contribution to the metabolism of fats, drugs, and proteins further supports overall bodily function and helps in the maintenance of a healthy liver.

THIAMINE (B1)

Short Description: Thiamine (B1) treat beriberi, prevent Wernicke-Korsakoff syndrome, support energy production from food, and maintain healthy nervous and cardiovascular systems.

Long Description: Thiamine, or Vitamin B1, is essential for health and wellness, serving as a cornerstone for energy metabolism. It helps convert nutrients into energy, particularly carbohydrates, making it vital for glucose metabolism. Thiamine supports the proper function of the heart and nervous system, playing a key role in nerve transmission. Its deficiency can lead to disorders like beriberi and Wernicke-Korsakoff syndrome, highlighting its importance in maintaining cognitive functions and overall cardiovascular health. Regular intake ensures a well-functioning metabolic and nervous system.

ASCORBIC ACID (VITAMIN C)

Short Description: Vitamin C boosts immune function, support wound healing, enhance iron absorption, prevent scurvy, and may improve skin health by promoting collagen production.

Long Description: Vitamin C is a water-soluble vitamin that is essential in the body to produce collagen, modulate the immune system, perform antioxidant functions, and heal wounds. As this is water soluble, any excess is usually eliminated rapidly and by the kidneys in the urine. Vitamin C is commonly used in IV therapies and in treating conditions like scurvy (rare today, caused by Vit. C deficiency).

VITAMIN BLEND 30

Short Description: A customized blend of vitamins to help with overall wellness improvement.

ALPHA-LIPOIC ACID

Short Description: Alpha-lipoic acid injections help manage diabetes symptoms, reduce nerve damage pain, support weight loss, and act as a powerful antioxidant for overall health.

Long Description: Alpha-Lipoic Acid (ALA) is a naturally occurring antioxidant critical for cellular energy production. It assists in breaking down carbohydrates to fuel the body's energy needs. Besides its fundamental role in metabolism, ALA has been noted for its

potential in managing chronic conditions linked to oxidative stress, such as diabetic neuropathy. Its antioxidant properties may also contribute to reducing inflammation, slowing skin aging, promoting healthy nerve function, and lowering the risk of heart disease, making it a valuable supplement for enhancing overall health and wellness.

L-ARGININE (ARG)

Short Description: L-Arginine injections improve heart health, enhance blood flow, support wound healing, boost immune function, and may help manage erectile dysfunction in men.

Long Description: L-Arginine is an amino acid that is known to aid in vasodilation. This amino acid works by relaxing the smooth muscle in the blood vessels to increase overall blood flow in the body. This may help reduce high blood pressure, alleviate erectile dysfunction, and increase exercise performance. Injecting this amino acid prior to exercise may help improve performance during workouts through enhanced vasodilation.

L-CARNITINE

Short Description: L-Carnitine injections aid in weight loss, enhance exercise performance, boost energy production, support heart health, and improve brain function and well-being.

Long Description: L-Carnitine, a vital amino acid derivative, is instrumental in the body's energy production process, facilitating the transport of fatty acids into mitochondria for metabolism. It's renowned for its ability to enhance physical performance and endurance by improving energy efficiency and reducing muscle fatigue. Beyond exercise enhancement, L-Carnitine offers significant benefits in weight management, heart health, and cognitive function. It supports cardiovascular wellness by aiding in the prevention of ischemic damage and improving symptoms of heart failure and peripheral artery disease. Furthermore, its potential neuroprotective effects contribute to improved brain health, making it a comprehensive supplement for overall health improvement.

L-GLUTAMINE (GLN)

Short Description: L-Glutamine injections help reduce sickle cell disease crises, support digestive health, aid in muscle growth, and alleviate effects of cancer treatments.

Long Description: L-Glutamine is an essential amino acid crucial for numerous bodily

functions, including supporting immune system health, aiding in gut integrity, and facilitating muscle repair and growth. It serves as a primary energy source for immune cells and intestinal cells, thereby playing a vital role in maintaining gut health and boosting immunity. Additionally, L-Glutamine's ability to promote muscle recovery makes it popular among athletes and those engaging in rigorous physical activities. Its supplementation has also been linked to improved brain function and reduced stress by aiding in the production of neurotransmitters, making it beneficial for both physical and mental wellness.

L-GLUTATHIONE

Short Description: L-Glutathione injections may improve liver health, prevent Alzheimer's, Parkinson's disease, reduce oxidative stress, enhance immune function, and offer skin whitening benefits.

Long Description: L-Glutathione, often hailed as the "master antioxidant," is a tripeptide composed of three amino acids that plays a pivotal role in protecting cells from oxidative stress and damage. It supports detoxification processes, strengthens the immune system, and promotes skin health by aiding in the reduction of melanin production, which can lead to a brighter complexion. Additionally, L-Glutathione's antioxidant properties are crucial for maintaining overall cellular health, reducing inflammation, and potentially slowing the aging process. Its ability to regenerate other antioxidants like vitamins C and E further amplifies its health benefits, making it a cornerstone in wellness regimens for its comprehensive protective and rejuvenating effects.

L-LYSINE (LYS)

Short Description: L-Lysine injections promote collagen synthesis for healthier skin, enhance calcium absorption, support immune function, may reduce anxiety, and help in muscle repair.

Long Description: L-Lysine is an essential amino acid vital for protein synthesis, immune system function, and the production of enzymes and hormones. It plays a key role in calcium absorption, promoting bone health and aiding in the prevention of osteoporosis. Additionally, L-Lysine is crucial for collagen formation, supporting skin health and wound healing. Its antiviral properties are particularly effective against herpes simplex virus, helping to prevent cold sores and reduce their recurrence. By bolstering the immune response and contributing to the maintenance of healthy tissues, L-Lysine serves as a foundational nutrient for overall health and wellness.

L-PROLINE (PRO)

Short Description: L-Proline injections support collagen production for healthy skin and joints, aid wound healing, improve gut health, and may help maintain heart health.

Long Description: L-Proline is a non-essential amino acid that plays a significant role in the body's production of collagen, making it crucial for skin health, joint function, and wound healing. It supports the maintenance of connective tissues throughout the body, including ligaments, tendons, and heart muscles, contributing to cardiovascular health by assisting in the repair of blood vessel walls. Additionally, L-Proline acts as an antioxidant, helping to combat oxidative stress and potentially reducing the risk of chronic diseases. Its involvement in collagen synthesis also benefits the integrity of the gut lining, promoting digestive health. L-Proline is thus integral to maintaining overall structural health and wellness.

L-TAURINE

Short Description: L-Taurine injections may lower blood pressure, calm the nervous system, reduce inflammation, protect the heart, support nerve growth, and aid in liver health.

Long Description: L-Taurine is a conditionally essential amino acid that plays a crucial role in various physiological processes, including bile salt formation, eye health, and cardiovascular function. It supports healthy metabolism and has been shown to aid in the management of blood sugar levels, making it beneficial for individuals with diabetes. L-Taurine's antioxidant properties help protect cells against oxidative stress, contributing to reduced inflammation and enhanced detoxification. Additionally, it improves exercise performance by reducing fatigue and muscle damage. Its broad spectrum of benefits makes L-Taurine a valuable nutrient for supporting overall health and wellness, particularly in areas related to metabolic and cardiovascular health.

N-ACETYL-CYSTEINE

Short Description: N-Acetyl-Cysteine injection aids as a potent antioxidant, and supports kidney and liver health.

Long Description: N-Acetyl-Cysteine (NAC) is a powerful antioxidant that boosts the body's production of glutathione, a critical molecule for detoxification and cellular protection. It plays a vital role in supporting respiratory health by thinning mucus and enhancing lung function, making it beneficial for individuals with chronic bronchitis or other pulmonary conditions. NAC also supports liver health by aiding in the

detoxification process and may protect against liver damage. Additionally, its antioxidant properties help combat oxidative stress, potentially reducing the risk of chronic diseases and improving immune function. NAC is thus essential for maintaining overall health, particularly in detoxification and respiratory wellness.

GAC

Short Description: GAC injections enhance energy, promote fat loss, increase muscle mass, improve stamina and strength, and support efficient energy metabolism for overall wellness.

Long Description: Glutamine-Arginine-Carnitine (GAC) is a combination of amino acids that together work to help improve exercise performance. By directly injecting key amino acids into the muscle or into the fat, it is possible to induce increases in vasodilation (commonly referred to as a “pump”), muscle recovery, and mental focus. Injecting GAC prior to exercise is the best way to use this product to and get maximum benefit from the amino acid blend.

AMINO BLEND

Short Description: Amino Blend injections support muscle growth, enhance recovery, boost energy levels, improve metabolic function, and aid in overall wellness and physical performance.

Long Description: An Amino Blend is a comprehensive mixture of essential and non-essential amino acids designed to support various aspects of health and wellness. By supplying the building blocks of proteins, this blend aids in muscle repair, growth, and recovery, making it particularly beneficial for athletes and individuals engaged in regular physical activity. Additionally, it supports immune function, enhances mood by influencing neurotransmitter production, and promotes healthy metabolism. Amino Blends can also improve skin, hair, and nail health due to their role in collagen synthesis. Overall, they are crucial for maintaining muscle health, metabolic efficiency, and general well-being.

NAD+ (Lyophilized)

Short Description: Amino Blend injections support muscle growth, enhance recovery, boost energy levels, improve metabolic function, and aid in overall wellness and physical performance.

Long Description: NAD is an abbreviation for Nicotinamide Adenine Dinucleotide, an essential coenzyme necessary for overall metabolism. It exists in two forms, the oxidized state known as NAD⁺ and the reduced state known as NADH. Functionally, these two states serve as electron carriers from one reaction to another in various metabolic processes. Levels of NAD⁺ decline with age, intuitively, this decline lowers the overall rate at which NAD⁺ dependent metabolic reactions take place. Patients who have administered NAD⁺ injections or nasal spray have reported accelerated recovery after workouts, improved fatigue, mental clarity, and overall mood.

WEIGHT LOSS

MIC

Short Description: MIC injections promote weight loss, enhance metabolism, increase energy levels, reduce appetite, and improve fat mobilization for better overall health and wellness.

Long Description: MIC (Methionine-Inositol-Carnitine) A combination of amino acids that work together to create carnitine and also while supplementing with carnitine. This supplying of these amino acids allows the burning of fat throughout the body, along with increases in energy output, and improvements in body composition. MIC injections can help the body have favorable changes into making exercise more effective.

MICC

Short Description: MICC injections aid in weight loss, boost energy, enhance liver function, improve fat metabolism, and support overall health for a balanced wellness approach.

Long Description: MICC is a compound formula consisting of Methionine, Inositol, Choline, and Cyanocobalamin (Vitamin B12), designed to support weight loss and liver health. Methionine aids in detoxification processes and acts as an antioxidant. Inositol improves insulin sensitivity, which can assist in managing blood sugar levels. Choline is vital for fat metabolism and liver function, helping prevent fat accumulation in the liver. Cyanocobalamin boosts energy levels and supports the nervous system. Together, these components make MICC an effective supplement for enhancing metabolic health, promoting fat loss, and supporting overall liver and cellular wellness, contributing to improved energy and well-being.

PHTERMININE/CHROMIUM PICOLINATE

Short Description: Phentermine/Chromium Picolinate aids in weight loss by reducing appetite, enhancing energy use, and curbing cravings for effective diet and exercise support.

Long Description: Phentermine/Chromium Picolinate is a combination used to aid weight loss and improve metabolic health. Phentermine, an appetite suppressant, helps reduce hunger, leading to lower calorie intake. Chromium Picolinate enhances the action of insulin, improving blood sugar control and potentially reducing cravings for carbohydrate-rich foods. Together, they can help manage weight by controlling appetite

and stabilizing blood sugar levels, contributing to overall metabolic wellness. This combination may be particularly beneficial for individuals struggling with obesity or metabolic syndrome, supporting their journey towards healthier weights and improved metabolic markers.

TOPIRAMATE/BUPROPION/NALTREXONE/MET(B12)/PHENTERMINE

Short Description: Combines appetite suppression, mood enhancement, metabolic boost, and energy increase, targeting obesity's multifaceted challenges for effective weight management and well-being.

Long Description: Topiramate/Bupropion/Naltrexone/Met(B12)/Phentermine is a multifaceted combination used primarily for weight management and metabolic health improvement. Topiramate suppresses appetite and may reduce binge eating episodes. Bupropion, an antidepressant, helps in weight loss by reducing hunger. Naltrexone works by controlling food cravings. Methylcobalamin (Vitamin B12) boosts energy and metabolism, while Phentermine decreases appetite. Together, this combination addresses various factors of weight loss, from appetite suppression to energy enhancement, making it an effective tool for obesity treatment and overall wellness improvement, particularly for individuals struggling with weight-related health issues.

CAFFEINE/PHENTERMINE/NALTREXONE/MET(B12)

Short Description: Enhances energy, suppresses appetite, promotes weight loss, and boosts metabolism, offering a dynamic approach to achieving a healthier weight and improved vitality.

Long Description: Caffeine/Phentermine/Naltrexone/Met(B12) is a potent combination designed for weight management and enhanced metabolic health. Caffeine boosts energy levels and metabolism, aiding in fat burning. Phentermine suppresses appetite, leading to reduced calorie intake. Naltrexone helps manage cravings and emotional eating by affecting the brain's reward pathways. Methylcobalamin (Vitamin B12) supports energy production and overall metabolic function. Together, this blend promotes significant weight loss, improves metabolic efficiency, and increases energy levels, making it a comprehensive approach for individuals seeking to lose weight while enhancing their overall wellness and vitality.

PHOSPHATIDYLCHOLINE/DEOXYCHOLATE

Short Description: Targets fat reduction and improves liver health by breaking down fat cells and promoting their removal, leading to a more contoured body shape.

Long Description: Phosphatidylcholine/Deoxycholate is a combination used in aesthetic medicine, primarily for the non-surgical reduction of localized fat deposits.

Phosphatidylcholine, a component of lecithin, breaks down fat cells, while Deoxycholate, a bile acid, aids in the emulsification and removal of these fats from the body. This treatment can improve body contouring and reduce the appearance of stubborn fat areas, leading to improved physical appearance and self-confidence. It's particularly beneficial for areas resistant to diet and exercise, offering a targeted approach to enhancing body aesthetics and promoting overall wellness by contributing to a healthier body composition.

PHENTERMINE CAPSULE (COMMERCIAL/GENERIC)

Short Description: Maximizes appetite suppression, boosts energy levels, and aids in significant weight loss, facilitating a focused approach towards achieving weight management goals.

Long Description: Phentermine is a prescription medication primarily utilized for weight loss by individuals who are overweight or obese, in conjunction with a doctor-approved exercise, behavior modification, and reduced-calorie diet plan. It functions as an appetite suppressant, aiding users in consuming fewer calories by making them feel fuller for longer periods. This medication is typically prescribed for short-term use to jumpstart the weight loss process in patients who have struggled to lose weight through diet and exercise alone, thereby contributing to improved health outcomes and a reduction in obesity-related health risks.

PHENTERMINE TABLET (COMMERCIAL/GENERIC)

Short Description: Maximizes appetite suppression, boosts energy levels, and aids in significant weight loss, facilitating a focused approach towards achieving weight management goals.

Long Description: Phentermine is a prescription medication primarily utilized for weight loss by individuals who are overweight or obese, in conjunction with a doctor-approved exercise, behavior modification, and reduced-calorie diet plan. It functions as an appetite suppressant, aiding users in consuming fewer calories by making them feel fuller for longer periods. This medication is typically prescribed for short-term use to jumpstart the weight loss process in patients who have struggled to lose weight through diet and exercise alone, thereby contributing to improved health outcomes and a

reduction in obesity-related health risks.

SEMAGLUTIDE 1 mg, 2 mg, 2.5 mg, 20 mg

Short Description: Enhances glucose control, promotes substantial weight loss, and reduces appetite, supporting comprehensive diabetes management and improved cardiovascular health.

Long Description: Semaglutide is a GLP-1 medication that has been used for glucose control and also to decrease appetite. By reducing the transportation of food through the gastrointestinal tract, this makes the user feel fuller for longer allowing them to intake a lower amount of food thus allowing them to stick to a regulated diet. This medication is administered via injection once per week.

Tirzepatide

Short Description: Tirzepatide, expertly compounded for precision and efficacy. Tailored dosing for optimal metabolic control and weight management. Transform your health safely and effectively.

Long description: Introducing compounded Tirzepatide, a revolutionary approach to managing type 2 diabetes and obesity. This innovative medication combines the benefits of GLP-1 and GIP receptor agonism, offering superior blood sugar control and significant weight loss potential. Custom-compounded for individual patient needs, Tirzepatide provides a personalized treatment experience, ensuring optimal efficacy with minimal side effects. Ideal for those seeking an advanced alternative to traditional therapies, compounded Tirzepatide not only improves glycemic levels but also supports cardiovascular health, making it a comprehensive solution for enhancing overall well-being in patients with type 2 diabetes and obesity. Experience the future of diabetes and weight management treatment with compounded Tirzepatide.

NALTREXONE

Short Description: Reduces cravings, supports weight loss, improves inflammation markers, and aids in recovery from alcohol and opioid dependence, fostering overall well-being.

Long Description: Naltrexone is a medication primarily used for managing alcohol and opioid dependence, promoting recovery and abstinence from these substances. Beyond its use in addiction treatment, Naltrexone is gaining attention for its potential benefits in weight management, especially when combined with other medications. It works by blocking the euphoric effects of opioids and the rewarding effects of alcohol consumption, thereby reducing cravings. Additionally, when used in lower doses, it may

help with chronic pain and certain autoimmune conditions by modulating the immune system, contributing to an improved quality of life and overall wellness.

BUPROPION

Short Description: Elevates mood, aids in depression relief, assists in weight management, and enhances energy levels, contributing to improved mental and physical health.

Long Description: Bupropion is a medication primarily prescribed to treat major depressive disorder and seasonal affective disorder, offering significant benefits in mental health and emotional well-being. By inhibiting the reuptake of norepinephrine and dopamine, it enhances mood and alleviates symptoms of depression. Additionally, Bupropion is used to aid in smoking cessation, helping individuals overcome nicotine addiction by reducing cravings and withdrawal effects. This dual action of improving mental health and assisting in smoking cessation contributes to overall wellness, including reduced risk of smoking-related diseases, enhanced emotional stability, and improved quality of life.

TOPIRAMATE (COMMERCIAL)

Short Description: Reduces migraine frequency, aids in weight loss, and helps control seizures, offering a multi-faceted approach to improving neurological and overall health

Long Description: Topiramate is a versatile medication primarily used for the management of epilepsy and the prevention of migraine headaches. By stabilizing nerve activity in the brain, it effectively reduces the frequency of seizures in individuals with epilepsy and decreases the occurrence of migraine episodes, significantly improving the quality of life for those affected by these conditions. Additionally, Topiramate has been studied for its potential benefits in weight management, as some users experience weight loss as a side effect. This multifaceted drug contributes to enhanced neurological health and, indirectly, to overall wellness by addressing key areas of concern.

BENZPHETAMINE

Short Description: Enhances focus, suppresses appetite, and boosts energy levels, aiding in weight management and improving concentration for a more productive and healthier lifestyle.

Long Description: Benzphetamine is a prescription medication primarily used as a short-term adjunct in the management of obesity. It functions as an appetite suppressant, aiding in weight reduction for individuals struggling with obesity-related

health issues. By stimulating the central nervous system, Benzphetamine increases heart rate and blood pressure, resulting in decreased appetite. This pharmacological approach to weight loss can significantly improve cardiovascular health, reduce the risk of diabetes, and enhance mobility and overall physical wellness. Its use, alongside lifestyle modifications like diet and exercise, supports individuals in achieving a healthier weight and improving their quality of life.

PHENDIMETRAZINE

Short Description: Stimulates metabolism, suppresses appetite, and increases energy, facilitating weight loss and enhancing focus for a more active and fulfilling daily life.

Long Description: Phendimetrazine is a stimulant drug prescribed as a short-term adjunct to diet and exercise for the treatment of obesity. It works by stimulating the central nervous system, which increases heart rate and blood pressure, leading to reduced appetite and caloric intake. This pharmacological intervention aids in weight loss, which can significantly improve cardiovascular health, decrease the risk of diabetes, enhance mobility, and boost overall physical well-being. By supporting individuals in achieving and maintaining a healthier weight, Phendimetrazine plays a crucial role in promoting a comprehensive approach to wellness and improving the quality of life for those dealing with obesity.

DIETHYLPROPION

Short Description: Promotes appetite suppression, boosts energy, and aids in effective weight management, leading to improved health and confidence in a controlled manner.

Long Description: Diethylpropion is a prescription medication designed as a short-term supplement to diet and exercise in the treatment of obesity. It acts as an appetite suppressant by influencing the central nervous system, thereby helping individuals reduce their caloric intake. The primary health improvement associated with Diethylpropion is weight loss, which can significantly lower the risk of chronic conditions such as diabetes, hypertension, and heart disease. By aiding in the achievement of a healthier body weight, Diethylpropion contributes to enhanced cardiovascular health, improved mobility, and overall better physical and mental well-being, fostering a more active and fulfilling lifestyle.

ERECTILE DYSFUNCTION (Troches, tablets, capsules, or RDT)

SILDENAFIL (COMMERCIAL)

Short Description: Enhances erectile function, improves sexual performance, and increases blood flow, providing relief from erectile dysfunction for a more satisfying intimate experience.

Long Description: Sildenafil is generic Viagra, a PDE-5 inhibitor that decreases the blood pressure and increases the blood flow in patients by relaxing their blood vessels. This medication is utilized in erectile dysfunction commonly to improve erectile quality in men that have issues with blood flow. This medication is typically taken orally 1 hour prior to sexual activity, on an empty stomach, and the effects last 4-6 hours. This form of Sildenafil is an FDA approved generic from a commercial manufacturer.

TADALAFIL (COMMERCIAL)

Short Description: Improves erectile function, extends sexual performance duration, and supports urinary health, offering a comprehensive solution for enhanced intimacy and well-being.

Long Description: Tadalafil is a PDE-5 inhibitor that works to relax the blood vessels throughout the body and create better blood flow to assist obtaining an erection in men with erectile dysfunction. The differences between sildenafil and tadalafil is that sildenafil has a shorter active life, and tadalafil works much longer requiring only a once per day administration to get continual effects. Due to this easier administration that can help patients with administration and care of their erectile dysfunction. Additionally, it has also been approved by the FDA to treat men with BPH who suffer from lower urinary tract symptoms. This form of Tadalafil is an FDA approved generic from a commercial manufacturer.

SILDENAFIL/APOMORPHINE

Short Description: Boosts erectile function, enhances sexual arousal, and improves overall sexual experience through dual-action mechanism, offering a significant advancement in treatment options.

Long Description: Sildenafil/Apomorphine is a combination therapy used primarily to treat erectile dysfunction (ED) in men. Sildenafil works by increasing blood flow to the penis to help achieve and maintain an erection, while Apomorphine acts on the brain to enhance the sexual response. This dual approach not only improves sexual performance and satisfaction but also positively impacts emotional health and relationships affected by ED. By addressing this intimate aspect of wellness, Sildenafil/Apomorphine promotes improved mental health, confidence, and overall quality of life, contributing to a holistic sense of well-being.

SILDENAFIL 40 mg, 75 mg

Short Description: Enhances erectile function, improves sexual performance, and increases blood flow, providing relief from erectile dysfunction for a more satisfying intimate experience.

Long Description: Sildenafil is generic Viagra, a PDE-5 inhibitor that decreases the blood pressure and increases the blood flow in patients by relaxing their blood vessels. This medication is utilized in erectile dysfunction commonly to improve erectile quality in men that have issues with blood flow. This medication is typically taken orally 1 hour prior to sexual activity, on an empty stomach, and the effects last 4-6 hours. This form of Sildenafil comes specially compounded in a RDT (Rapid Dissolve Tablet), Troche, or capsule.

TADALAFIL 7 mg, 25 mg

Short Description: Improves erectile function, extends sexual performance duration, and supports urinary health, offering a comprehensive solution for enhanced intimacy and well-being.

Long Description: Tadalafil is a PDE-5 inhibitor that works to relax the blood vessels throughout the body and create better blood flow to assist obtaining an erection in men with erectile dysfunction. The differences between sildenafil and tadalafil is that sildenafil has a shorter active life, and tadalafil works much longer requiring only a once per day administration to get continual effects. Due to this easier administration that can help patients with administration and care of their erectile dysfunction. Additionally, it has also been approved by the FDA to treat men with BPH who suffer from lower urinary tract symptoms. This form of Tadalafil comes specially compounded in a RDT (Rapid Dissolve Tablet), Troche, or capsule.

TADALAFIL/A POMORPHINE

Short Description: Combines improved erectile function with increased sexual desire, offering a potent dual-action treatment for a more fulfilling and spontaneous intimate life.

Long Description: Tadalafil/Apomorphine is a combination treatment aimed at enhancing sexual function, specifically targeting erectile dysfunction (ED) in men. Tadalafil assists by increasing blood flow to the penis, facilitating the achievement and maintenance of an erection, while Apomorphine stimulates the brain's receptors involved in sexual arousal. This synergistic approach not only boosts sexual performance but also contributes to significant improvements in psychological health, self-esteem, and interpersonal relationships. By addressing these crucial aspects of male wellness, Tadalafil/Apomorphine supports a more satisfying sex life, fostering overall emotional well-being and enhancing life quality.

VARDENAFIL

Short Description: Enhances erectile function, increases sexual satisfaction, and provides rapid onset of action for a reliable and improved intimate experience.

Long Description: Vardenafil is a pharmaceutical drug specifically designed to treat erectile dysfunction (ED) in men. By relaxing muscles and increasing blood flow to the penis, Vardenafil helps individuals achieve and maintain an erection conducive to sexual activity. The improvement in sexual function directly enhances sexual satisfaction and emotional well-being, positively affecting relationships and self-confidence. Furthermore, addressing ED can alleviate stress and anxiety related to sexual performance, contributing to better mental health. Overall, Vardenafil supports a healthier and more fulfilling sexual life, which is an integral component of physical and psychological wellness.

ERECTILE DYSFUNCTION (Liquid Drops & Gels)

SILDENAFIL LIQUID

Short Description: Sildenafil liquid drops offer a convenient, fast-acting solution for erectile dysfunction, enhancing sexual performance and satisfaction with ease of use.

Long Description: Sildenafil is generic Viagra, a PDE-5 inhibitor that decreases the blood pressure and increases the blood flow in patients by relaxing their blood vessels. This medication is utilized in erectile dysfunction commonly to improve erectile quality in men that have issues with blood flow. This medication is typically taken orally 1 hour prior to sexual activity, on an empty stomach, and the effects last 4-6 hours. This form of Sildenafil comes specially compounded in a liquid dropper that is best taken by placing the prescribed dose under the tongue for enhanced absorption.

TADALAFIL LIQUID

Short Description: Tadalafil liquid drops provide long-lasting erectile dysfunction relief, enhancing sexual performance with a convenient, fast-absorbing formula for spontaneous intimacy.

Long Description: Tadalafil is a PDE-5 inhibitor that works to relax the blood vessels throughout the body and create better blood flow to assist obtaining an erection in men with erectile dysfunction. The differences between sildenafil and tadalafil is that sildenafil has a shorter active life, and tadalafil works much longer requiring only a once per day administration to get continual effects. Due to this easier administration that can help patients with administration and care of their erectile dysfunction. Additionally, it has also been approved by the FDA to treat men with BPH who suffer from lower urinary tract symptoms. This form of Tadalafil comes specially compounded in a liquid dropper that is best taken by placing the prescribed dose under the tongue for enhanced absorption.

SILDENAFIL GEL

Short Description: Sildenafil gel offers a discreet, easy-to-use option for erectile dysfunction, improving sexual function and satisfaction with quick absorption and onset.

Long Description: Sildenafil is generic Viagra, a PDE-5 inhibitor that decreases the blood pressure and increases the blood flow in patients by relaxing their blood

vessels. This medication is utilized in erectile dysfunction commonly to improve erectile quality in men that have issues with blood flow. This medication is typically taken orally 1 hour prior to sexual activity, on an empty stomach, and the effects last 4-6 hours. This form of Sildenafil comes specially compounded in a gel packet that is best taken by placing the gel in between the cheek and gum, and slowly allowing it to dissolve.

TADALAFIL GEL

Short Description: Tadalafil gel ensures prolonged relief from erectile dysfunction, enhancing sexual readiness with its fast-acting, easy-to-apply formula for sustained performance.

Long Description: Tadalafil is a PDE-5 inhibitor that works to relax the blood vessels throughout the body and create better blood flow to assist obtaining an erection in men with erectile dysfunction. The differences between sildenafil and tadalafil is that sildenafil has a shorter active life, and tadalafil works much longer requiring only a once per day administration to get continual effects. Due to this easier administration that can help patients with administration and care of their erectile dysfunction. Additionally, it has also been approved by the FDA to treat men with BPH who suffer from lower urinary tract symptoms. This form of Tadalafil comes specially compounded in a gel packet that is best taken by placing the gel in between the cheek and gum, and slowly allowing it to dissolve.

ARGININE/CITRULLINE

Short Description: Arginine/Citrulline supports erectile function by boosting nitric oxide levels, enhancing blood flow, and improving sexual stamina for a more satisfying experience.

Long Description: Arginine and Citrulline are amino acids that play a significant role in enhancing cardiovascular health, exercise performance, and recovery. When combined, they improve nitric oxide production, leading to vasodilation and improved blood flow.

This mechanism supports heart health by lowering blood pressure and improving circulation. For athletes and those engaged in regular physical activity, this duo aids in reducing muscle soreness, enhancing endurance, and promoting efficient nutrient delivery to tissues. Moreover, the Arginine/Citrulline combination supports immune function and may contribute to better sexual health by improving erectile function.

Overall, these amino acids offer comprehensive benefits for physical wellness and

performance optimization

SEXUAL DYSFUNCTION INTRACAVERNOSALI INJECTIONS

BIMIX ALPROSTADIL/PHENTOLAMINE

Short Description: BiMix Alprostadil/Phentolamine injections provide a potent, direct solution for erectile dysfunction, offering rapid onset and improved erectile quality for enhanced intimacy.

Long Description: BiMix, a combination of Alprostadil and Phentolamine, is a potent injectable treatment primarily used for erectile dysfunction (ED). This synergistic blend works by dilating blood vessels and relaxing smooth muscle tissue in the penis, promoting increased blood flow and facilitating an erection. Unlike oral ED medications, BiMix acts locally, offering a rapid onset of action with fewer systemic side effects. Its effectiveness in cases where oral therapies fail makes it a valuable option for men seeking to improve sexual health and performance. BiMix not only enhances erectile function but also positively impacts psychological well-being, confidence, and overall quality of life for men experiencing ED.

REVERSAL MEDICATIONS

PHENYLEPHRINE INJECTIONS

Short Description: Phenylephrine injection effectively reverses prolonged erections and acts as an antidote to priapism, restoring normal function while ensuring safety and comfort.

Long Description: Phenylephrine is a medication primarily used as a decongestant and to increase blood pressure, but it also finds application in reversing prolonged erections, a condition known as priapism, in men. Acting as a vasoconstrictor, it narrows the blood vessels in the penile tissue, helping to decrease blood flow and alleviate prolonged erections. This use of Phenylephrine can prevent potential tissue damage and erectile dysfunction that may result from untreated priapism. Its role in managing this urological emergency helps maintain sexual health and prevents long-term complications associated with extended erections.

TOPICAL PRODUCTS

SILDENAFIL/L-ARGININE

Short Description: Sildenafil/L-Arginine topical cream enhances female arousal by improving blood flow and sensitivity, leading to increased sexual desire and more fulfilling experiences.

Long Description: Sildenafil/L-Arginine topical formulations for women are designed to enhance sexual health by improving blood flow and arousal. This combination can significantly benefit those experiencing sexual dysfunction, such as difficulties with lubrication or achieving orgasm. Sildenafil, a vasodilator, increases blood flow to genital tissues, while L-Arginine boosts nitric oxide production, further enhancing vasodilation and sensitivity. Together, they promote genital engorgement, sensitivity, and natural lubrication, leading to more satisfying sexual experiences. This topical approach offers a targeted solution to improve sexual wellness, intimacy, and overall quality of life for women facing sexual health challenges.

SILDENAFIL/L-ARGININE/TESTOSTERONE

Short Description: This topical blend of Sildenafil, L-Arginine, and Testosterone boosts female libido, enhances arousal, and promotes sexual satisfaction through improved circulation and sensitivity.

Long Description: The topical blend of Sildenafil, L-Arginine, and Testosterone is crafted to address various aspects of women's sexual health. This potent combination aims to enhance blood flow, arousal, and libido. Sildenafil facilitates vasodilation, improving genital blood flow, while L-Arginine promotes nitric oxide production, boosting sensitivity and arousal. Testosterone, a key hormone in sexual desire, is included to elevate libido levels. Together, these components work synergistically to improve lubrication, increase sexual satisfaction, and enhance overall sexual function. This topical solution offers a comprehensive approach to rejuvenating sexual wellness and improving the quality of intimate experiences for women.

Scream Cream (Ergoloid Mesylate/Arginine)

Short Description: Scream Cream, with Ergoloid Mesylate and Arginine, intensifies female arousal, increases sensitivity, and enhances sexual pleasure for a more satisfying intimate experience.

Long Description: Scream Cream, featuring Ergoloid Mesylate and Arginine, is a topical cream designed to enhance women's sexual health by improving blood flow and arousal. When applied to the clitoris or external genitalia, it works by increasing nitric oxide production and vasodilation, leading to enhanced sensitivity, lubrication, and overall sexual pleasure. This innovative solution addresses challenges such as low libido and difficulties in achieving orgasm, contributing to improved sexual satisfaction and intimacy. By fostering a more fulfilling sexual experience, Scream Cream supports not only physical wellness but also emotional well-being and relationship quality for women.

Scream Cream (Ergoloid Mesylate/Testosterone)

Short Description: Scream Cream combines Ergoloid Mesylate and Testosterone to enhance female arousal, increase desire, and intensify sensations for a more fulfilling sexual experience.

Long Description: Scream Cream, formulated with Ergoloid Mesylate and Testosterone, is a topical cream designed to enhance women's sexual health. It aims to improve blood flow and arousal by combining the effects of Ergoloid Mesylate, which increases blood circulation, with Testosterone, known to boost libido and sexual desire. This dual-action approach helps in enhancing sensitivity, lubrication, and overall sexual satisfaction. By addressing issues such as low libido and difficulties in achieving orgasm, Scream Cream contributes to better sexual wellness, emotional well-being, and intimacy between partners, offering a holistic improvement in quality of life for women.

Scream Cream (Ergoloid Mesylate/Testosterone/Arginine)

Short Description: Scream Cream, blending Ergoloid Mesylate, Testosterone, and Arginine, boosts female arousal, desire, and pleasure, delivering a more intense and satisfying sexual experience.

Long Description: Scream Cream, a compounded topical cream containing Ergoloid Mesylate, Testosterone, and Arginine, is designed to enhance women's sexual health by targeting several key areas of wellness. Ergoloid Mesylate increases blood flow, improving sexual pleasure, while Testosterone boosts libido and sexual desire. Arginine enhances nitric oxide production, further aiding in vasodilation and sensitivity. This combination effectively promotes increased arousal, improved lubrication, and heightened sexual satisfaction. By addressing physical and emotional aspects of sexual function, Scream Cream supports a healthier, more fulfilling sexual experience and overall well-being for women.

Sertraline (COMMERCIAL)

Short Description: Sertraline effectively treats depression, anxiety, and premature ejaculation, promoting mental well-being, emotional stability, and enhanced sexual satisfaction and control.

Long Description: Sertraline, primarily known as an antidepressant, is also used off-label to treat premature ejaculation in men. By increasing serotonin levels in the brain, sertraline can delay ejaculation, extending the duration of sexual intercourse and enhancing sexual satisfaction. Its use for this condition reflects a psychological wellness approach, addressing the stress and anxiety often associated with sexual performance. Consequently, sertraline not only improves sexual function but also boosts confidence and emotional well-being, leading to improved relationship quality and overall mental health for men facing premature ejaculation challenges.

PE Spray

Short Description: PE Spray offers targeted, rapid relief for premature ejaculation, enhancing sexual endurance, prolonging pleasure, and boosting confidence in intimate moments.

Long Description: PE spray, or Premature Ejaculation spray, is a topical solution designed specifically for men to combat premature ejaculation and enhance sexual health. By applying the spray to the penis, it reduces sensitivity without completely numbing the area, allowing for extended sexual intercourse. This innovative approach directly addresses the physical aspect of premature ejaculation, leading to significant improvements in sexual performance, confidence, and satisfaction. The use of PE spray not only aids in prolonging ejaculation but also contributes to better emotional well-being and intimacy in relationships, fostering a healthier sexual life and overall mental health for men.

HRT (Topical)

ESTRACE VAGINAL (COMPOUNDED)

Short Description: ESTRACE VAGINAL (Compounded) alleviates menopausal symptoms, rejuvenates vaginal health, enhances moisture and elasticity, reducing discomfort for a revitalized intimate experience.

Long Description: Vaginal estradiol is a prescription medicine used to treat the symptoms of vulvar and vaginal atrophy in menopause, the cause of postmenopausal vaginal dryness. Vaginal estradiol may be used alone or with other medications. Vaginal estradiol belongs to a class of drugs called Estrogen Derivatives. It is typically applied with a measured applicator a few times a week.

BIEST 80/20

Short Description: BIEST 80/20, a balanced hormone therapy, effectively manages menopausal symptoms, promotes emotional well-being, and supports overall hormonal health for women.

Long Description: What exactly is biest? Biest is a combination of estrogens formulated into one compound. Thus the name “bi” (meaning two) and “est” (referring to estrogen). Biest includes a combination of the most powerful estrogen that your body produces naturally (estradiol) and a weaker, less potent estrogen (estriol). Estradiol, estriol, and estrone are the three types of estrogen circulating in a woman’s body. The balance of these hormones and others start to decline precipitously as a woman enters menopause. The only type of estrogen that is found in commercially available hormone products in the United States is estradiol. This estrogen may be found in either bioidentical, synthetic, or semi-synthetic forms.

BIEST 60/40

Short Description: BIEST 60/40 offers tailored hormone balance, easing menopausal discomfort, improving mood and energy levels, and fostering a sense of well-being in women.

Long Description: What exactly is biest? Biest is a combination of estrogens formulated into one compound. Thus the name “bi” (meaning two) and “est” (referring to estrogen). Biest includes a combination of the most powerful estrogen that your body produces naturally (estradiol) and a weaker, less potent estrogen (estriol). Estradiol, estriol, and estrone are the three types of estrogen circulating in a woman’s body. The balance of these hormones and others start to decline precipitously as a woman enters

menopause. The only type of estrogen that is found in commercially available hormone products in the United States is estradiol. This estrogen may be found in either bioidentical, synthetic, or semi-synthetic forms.

BIEST 50/50

Short Description: BIEST 50/50 harmonizes estrogen levels, reducing menopausal symptoms, enhancing skin health, and boosting vitality for a more comfortable and energetic life in women.

Long Description: What exactly is biest? Biest is a combination of estrogens formulated into one compound. Thus the name “bi” (meaning two) and “est” (referring to estrogen). Biest includes a combination of the most powerful estrogen that your body produces naturally (estradiol) and a weaker, less potent estrogen (estriol). Estradiol, estriol, and estrone are the three types of estrogen circulating in a woman’s body. The balance of these hormones and others start to decline precipitously as a woman enters menopause. The only type of estrogen that is found in commercially available hormone products in the United States is estradiol. This estrogen may be found in either bioidentical, synthetic, or semi-synthetic forms.

ESTRADIOL CREAM/GEL 4 MG/GM (0.4%), 5 MG/GM (0.5%), 6 MG/GM (0.6%), 7 MG/GM (0.7%), 8 MG/GM (0.8%)

Short Description: ESTRADIOL Cream/Gel effectively alleviates menopausal symptoms, promotes youthful skin, and supports intimate health, offering relief and confidence to women.

Long Description: Estradiol topical gel and emulsion (applied to skin) are used to treat and prevent hot flashes (hot flashes; sudden strong feelings of heat and sweating) in women who are experiencing menopause (change of life; the end of monthly menstrual periods). Estradiol topical gel is also used to treat vaginal dryness, itching, and burning in women who are experiencing menopause. However, women whose only bothersome symptoms are vaginal burning, itching, and dryness may benefit more from a medication that is applied topically to the vagina. Estradiol is in a class of medications called estrogen hormones. It works by replacing estrogen that is normally produced by the body that declines as we age.

ESTRIOL CREAM/GEL 0.6 MG/GM (0.06%), 1 MG/GM (0.1%), 2 MG/GM (0.2%)

Short Description: ESTRIOLO Cream/Gel gently soothes menopausal discomfort, enhances skin elasticity, and maintains urogenital health, providing gentle, effective relief for women.

Long Description: Estriol is one of three estrogen hormones produced by our bodies. Estriol levels rise throughout pregnancy, helping to keep your uterus and unborn baby healthy. The levels are at their highest right before childbirth. They help prepare your body for labor and delivery. Everyone makes some amount of estriol endogenously in their bodies. But in people who aren't pregnant, the levels are low or nearly undetectable. Other names for estriol include oestriol and E3. Estriol is the weakest of the three estrogen types. It's less likely to cause side effects like high blood pressure and blood clots than estradiol, the strongest and most potent estrogen. Estriol is typically delivered in a compounded topical formulation that is applied to the skin.

DHEA 10 MG/GM (1%), 50 MG/GM (5%)

Short Description: DHEA 10 mg/gm (1%) or 50 mg/gm (5%) boosts energy, supports healthy aging, enhances mood and libido, and improves overall well-being.

Long Description: Dehydroepiandrosterone (DHEA) is a hormone that your body naturally produces in the adrenal gland. DHEA helps produce other hormones, including testosterone and estrogen. Natural DHEA levels peak in early adulthood and then slowly fall as you age. DHEA is available OTC or compounded as a tablet, capsule, powder, topical cream and gel. People use DHEA as an anti-aging therapy and to improve physical performance. DHEA has also been used to treat depression and symptoms of menopause.

PROGESTERONE CREAM/GEL 10 MG/GM (1%), 50 MG/GM (5%), 100 MG/GM (10%), 200 MG/GM (20%)

Short Description: PROGESTERONE Cream/Gel balances hormones, eases menstrual and menopausal symptoms, improves sleep quality, and supports skin health for enhanced overall wellness.

Long Description: Progesterone cream is one component typically used in hormone replacement therapy (HRT). It may help reduce menopause symptoms, signs of skin aging, and bone loss that can lead to osteoporosis. Our progesterone cream contains natural plant-based compounds from soybeans and wild yams which are then transformed into bio-identical progesterone. Other hormone replacement options we offer include progesterone pills, suppositories, vaginal gels, and medicated patches placed on the skin.

TESTOSTERONE CREAM/GEL 10 MG/GM (1%), 20 MG/GM (2%), 30 MG/GM (3%), 40 MG/GM (4%), 50 MG/GM (5%)

Short Description: TESTOSTERONE Cream/Gel boosts strength, enhances libido, improves mood, increases energy levels, and supports muscle growth for a healthier,

more vibrant life.

Long Description: Topical testosterone is a form of testosterone that is compounded into a cream for application to the skin daily for replacement of testosterone for deficient individuals. Topical testosterone is well tolerated and the most common type of testosterone administration in the United States. These creams can be compounded with any additional hormone that is needed by the patient. These strengths are tailored largely towards women who are showing signs or symptoms of testosterone deficiency or are using the medication to increase libido.

HRT (Oral - Troches or Capsules)

BICALUTAMIDE 25, 50, 100 mg

Short Description: BICALUTAMIDE for transgender HRT reduces testosterone effects, aids in feminization, supports emotional well-being, and facilitates a smoother transition for transgender individuals.

ANASTROZOLE 0.1 MG, 0.2 MG, 0.3 MG, 0.5 MG, 0.75 MG

Short Description: ANASTROZOLE for male HRT, reduces estrogen and supports overall hormonal balance in men.

ANASTROZOLE (COMMERCIAL)

Short Description: ANASTROZOLE for male HRT, reduces estrogen and supports overall hormonal balance in men

Long Description: Anastrozole is also utilized in male Testosterone Replacement Therapy (TRT) to manage estrogen levels. In men undergoing TRT, testosterone can convert to estrogen, potentially leading to unwanted side effects such as gynecomastia (breast enlargement), water retention, and emotional fluctuations. By inhibiting the aromatase enzyme responsible for this conversion, Anastrozole helps maintain balanced estrogen levels, enhancing the effectiveness of TRT. This ensures optimal testosterone benefits like improved muscle mass, energy levels, libido, and mood stability, thereby contributing to overall physical health, psychological wellness, and an enhanced quality of life in men receiving TRT

TAMOXIFEN (COMMERCIAL)

Short Description: Tamoxifen for male HRT balances hormones, reduces gynecomastia risk, supports fertility, enhances testosterone efficacy, and improves overall hormonal health in men.

Long Description: Tamoxifen, traditionally used in treating breast cancer, has found its role in male Testosterone Replacement Therapy (TRT) as a means to mitigate side effects associated with elevated estrogen levels. For men on TRT, tamoxifen works by blocking estrogen receptors, particularly preventing gynecomastia (breast tissue growth) without significantly lowering serum estrogen levels. This selective action helps maintain the beneficial effects of estrogen on mood and cardiovascular health while enhancing TRT outcomes by preserving muscle gains, improving libido, and ensuring emotional stability. Thus, tamoxifen supports a balanced approach to male hormonal health, contributing to overall physical and emotional well-being.

ENCLOMIPHENE

Short Description: ENCLOMIPHENE for male HRT boosts natural testosterone production, improves libido, increases muscle mass, enhances mood, and supports reproductive health in men.

Long Description: Enclomiphene is used to raise serum total testosterone levels while maintaining sperm counts in the normal range in men with secondary hypogonadism. The drug has the potential to increase serum testosterone levels in men with secondary hypogonadism by restoring physiological endogenous testosterone secretion while maintaining testicular volume and, potentially, spermatogenesis. In clinical trials conducted to date, enclomiphene demonstrated significant efficacy in the physiological restoration of testosterone levels in males with secondary hypogonadism. The compound also exhibited an unanticipated favorable effect on fasting plasma glucose; this result has been accompanied by rapidly accumulating evidence from other researchers for a bidirectional relationship between low serum testosterone and obesity/metabolic syndrome (syndrome X) in men.

CLOMIPHENE

Short Description: CLOMIPHENE for male HRT stimulates natural testosterone increase, enhances fertility, boosts libido, improves energy levels, and supports overall hormonal balance in men.

CLOMIPHENE (COMMERCIAL)

Short Description: CLOMIPHENE for male HRT stimulates natural testosterone increase, enhances fertility, boosts libido, improves energy levels, and supports overall hormonal balance in men.

Long Description: Clomiphene citrate, commonly known as Clomid, is increasingly used in male Hormone Replacement Therapy (HRT) to address symptoms of low testosterone and infertility. By stimulating the body's natural production of testosterone, Clomid offers a non-invasive alternative to traditional testosterone injections. It effectively elevates serum testosterone levels and improves the testosterone/estrogen ratio, enhancing libido, mood, muscle mass, and overall energy levels. Additionally, Clomid's ability to preserve fertility makes it a preferred choice for younger men or those considering future fatherhood, thereby supporting both physical health and emotional well-being in men undergoing HRT.

ARMOUR THYROID ¼ grain (15 mg), ½ grain (30 mg). 1 grain (60 mg), 1.5 grain (90

mg), 2 grain (120 mg), 3 grain (180 mg)

Short Description: ARMOUR THYROID naturally manages hypothyroidism, boosts energy, supports weight loss, improves mood, enhances cognitive function, and restores overall thyroid hormone balance.

Long Description: Armour Thyroid is a natural prescription medicine made from desiccated animal thyroid that is used to treat the symptoms of low thyroid hormone (Hypothyroidism). Armour Thyroid may be used alone or with other medications.

NATURETHROID ¼ grain (15 mg), ½ grain (30 mg), 1 grain (60 mg)

Short Description: NATURETHROID effectively treats hypothyroidism, enhances energy levels, promotes weight management, improves mood stability, and supports natural thyroid hormone balance for overall well-being.

Long Description: Naturethroid is a natural prescription medicine made from desiccated animal thyroid that is used to treat the symptoms of low thyroid hormone (Hypothyroidism). Naturethroid may be used alone or with other medications.

LEVOTHYROXINE (T4)

Short Description: LEVOTHYROXINE (T4) regulates thyroid function, boosts energy, aids in weight loss, improves cognitive function, and stabilizes mood for enhanced overall health.

Long Description: Levothyroxine is a thyroid medicine that replaces a hormone normally produced by your thyroid gland to regulate the body's energy and metabolism. Levothyroxine is used to treat hypothyroidism (low thyroid hormone). This medicine is given when your thyroid does not produce enough of this hormone on its own.

LIOETHYRONINE (T3)

Short Description: LIOETHYRONINE (T3) accelerates metabolism, enhances energy, promotes weight loss, improves mental clarity, and balances mood, offering comprehensive thyroid support and well-being.

Long Description: Liothyronine is used to treat hypothyroidism (a condition where the thyroid gland does not produce enough thyroid hormone). Liothyronine is also used to treat a goiter (an enlarged thyroid gland) and to test for hyperthyroidism (a condition where the thyroid gland produces too much thyroid hormone). Liothyronine is in a class of medications called thyroid hormones. It works by supplying replacement thyroid hormones in persons with hypothyroidism.

PROGESTERONE 25 mg, 50 mg, 150 mg

Short Description: PROGESTERONE supports hormonal balance, enhances mood, promotes restful sleep, regulates menstrual cycles, and prepares the body for pregnancy, ensuring overall female health.

Long Description: Progesterone is used as a part of hormone replacement therapy in women who have passed menopause (the change of life) and have not had a hysterectomy (surgery to remove the uterus). Hormone replacement therapy usually includes an estrogen component, to treat hot flashes due to menopause and reduce the risk of developing certain diseases. However, estrogen can also cause abnormal thickening of the lining of the uterus and increase the risk of developing uterine cancer. Progesterone prevents this thickening and decreases the risk of complications from unopposed estrogen therapy. Progesterone is also used to bring on menstruation (period) in women of childbearing age who have had normal periods and then stopped menstruating. Progesterone is in a class of medications called progestins (female hormones). This is a specially compounded medication available in troches, capsules, RDT/SLT, suppository.

PROGESTERONE (COMMERCIAL) 100 mg

Short Description: PROGESTERONE supports hormonal balance, enhances mood, promotes restful sleep, regulates menstrual cycles, and prepares the body for pregnancy, ensuring overall female health.

Long Description: Progesterone is used as a part of hormone replacement therapy in women who have passed menopause (the change of life) and have not had a hysterectomy (surgery to remove the uterus). Hormone replacement therapy usually includes an estrogen component, to treat hot flashes due to menopause and reduce the risk of developing certain diseases. However, estrogen can also cause abnormal thickening of the lining of the uterus and increase the risk of developing uterine cancer. Progesterone prevents this thickening and decreases the risk of complications from unopposed estrogen therapy. Progesterone is also used to bring on menstruation (period) in women of childbearing age who have had normal periods and then stopped menstruating. Progesterone is in a class of medications called progestins (female hormones). This medication is supplied in the form of an FDA approved generic oil caplet.

ESTRADIOL (COMMERCIAL) 0.5 mg, 1 mg, 2 mg

Long Description: ESTRADIOL alleviates menopause symptoms, supports bone health, improves mood and skin elasticity, and maintains healthy reproductive tissues for enhanced female well-being.

Long Description: Estradiol is a form of estrogen, a female sex hormone that regulates many processes in the body. It is available as an oral tablet, a topical gel or patch, vaginal cream, or as an injection. Estradiol is used to treat menopause symptoms such as hot flashes and vaginal changes, and to prevent osteoporosis (bone loss) in menopausal women. Estradiol is also used to treat low estrogen levels in women with ovarian failure. It is also used to treat certain people who have gender dysphoria transition to female. This form of oral estradiol is supplied in the form of an FDA approved generic tablet. ****Blood estradiol levels may be higher if the tablet is placed under the tongue and allowed to dissolve.*

ESTRADIOL 0.25 MG - 4 MG

Short Description: ESTRADIOL alleviates menopause symptoms, supports bone health, improves mood and skin elasticity, and maintains healthy reproductive tissues for enhanced female well-being.

Long Description: Estradiol is a form of estrogen, a female sex hormone that regulates many processes in the body. It is available as an oral tablet, a topical gel or patch,

vaginal cream, or as an injection. Estradiol is used to treat menopause symptoms such as hot flashes and vaginal changes, and to prevent osteoporosis (bone loss) in menopausal women. Estradiol is also used to treat low estrogen levels in women with ovarian failure. It is also indicated to treat certain types of breast cancer and prostate cancer. This compounded form of estradiol is available in troches, capsules, RDT/SLT, suppository.

DERMATOLOGY (*Skin, Wrinkles, Scars*)

TRETINOIN

Short Description: TRETINOIN promotes cell turnover, reduces acne and wrinkles, evens skin tone, enhances collagen production, and improves overall skin texture for youthful radiance.

Long Description: Compounded Tretinoin topical preparation is a highly effective dermatological solution tailored for skin health enhancement. As a potent form of vitamin A, Tretinoin accelerates skin cell turnover, aiding in the reduction of acne, diminishing fine lines and wrinkles, and improving skin texture and tone. This preparation is particularly beneficial for those seeking to combat signs of aging, sun damage, and blemishes, promoting a clearer, more youthful complexion. By encouraging the renewal of healthy skin cells, it not only improves the skin's appearance but also supports its barrier function, contributing to overall dermatological wellness and confidence in one's skin.

HYDROQUINONE/ASCORBIC ACID

Short Description: HYDROQUINONE/ASCORBIC ACID brightens skin, fades dark spots, evens out skin tone, boosts collagen, and protects against oxidative damage for a radiant complexion.

Long Description: The compounded Hydroquinone/Ascorbic Acid topical preparation is a specialized skincare treatment designed for enhancing skin health and appearance. Hydroquinone, a powerful lightening agent, works effectively to reduce hyperpigmentation, age spots, and melasma, while Ascorbic Acid (Vitamin C) provides potent antioxidant protection, stimulates collagen production, and brightens the skin tone. Together, this synergistic formula targets uneven skin tone, promotes a more radiant and uniform complexion, and aids in the prevention of future discoloration. By improving the skin's overall texture and appearance, it boosts self-confidence and contributes to a healthier, more youthful-looking skin, enhancing one's wellness and quality of life.

HYDROQUINONE

Short Description: HYDROQUINONE effectively lightens dark spots, corrects hyperpigmentation, evens skin tone, and enhances overall complexion for a clearer, more uniform skin appearance.

Long Description: Compounded Hydroquinone topical preparation is a dermatologically advanced solution aimed at enhancing skin health through targeted pigmentation correction. As a leading depigmenting agent, Hydroquinone effectively lightens dark spots, melasma, and other forms of hyperpigmentation, resulting in a more even skin tone and improved texture. This preparation not only addresses the aesthetic concerns associated with uneven pigmentation but also boosts the skin's overall appearance, fostering improved self-esteem and psychological well-being. By promoting a clearer and more uniform complexion, it plays a crucial role in supporting comprehensive skin wellness and contributing to a healthier, more radiant appearance.

HYDROQUINONE/TRETINOIN

Short Description: HYDROQUINONE/TRETINOIN combines to lighten dark spots, smooth wrinkles, promote cell turnover, and improve skin texture for a clearer, more youthful complexion.

Long Description: Prescription dark-spot lightener. compounded Hydroquinone/Tretinoin topical preparation is a potent dermatological formula designed for optimal skin health improvement. By combining Hydroquinone, an effective skin lightening agent, with Tretinoin, a powerful form of vitamin A that accelerates cell turnover, this preparation effectively targets and reduces hyperpigmentation, age spots, and acne scars. It also diminishes fine lines and wrinkles, promoting a smoother, more youthful complexion. This dual-action approach not only enhances the skin's appearance by achieving a more even tone and texture but also boosts confidence and psychological wellness, contributing to an overall sense of well-being and improved quality of life.

HYDROQUINONE/TRETINOIN/VIT. C

Short Description: HYDROQUINONE/TRETINOIN/VIT. C synergistically fades discoloration, reduces wrinkles, stimulates collagen, and brightens skin for a radiant, evenly-toned, and rejuvenated complexion.

Long Description: Prescription Triple dark-spot lightener, when it is compounded Hydroquinone/Tretinoin/Vitamin C topical preparation is a multifaceted skincare solution designed for comprehensive skin health enhancement. This powerful combination harnesses Hydroquinone's ability to lighten hyperpigmentation, Tretinoin's efficacy in promoting cell renewal to reduce fine lines and acne, and Vitamin C's antioxidant properties to brighten and protect the skin. Together, they synergistically work to improve skin texture, tone, and overall appearance. This advanced formula not only addresses various skin

concerns, including aging and uneven complexion but also boosts self-confidence and psychological wellness by fostering healthier, more radiant skin, contributing significantly to one's overall well-being.

ANESTHETICS

BENZOCAINE/LIDOCAINE/TETRACAINE

Short Description: Topical anesthetic to help effectively aid in local area pain relief.

LIDOCAINE/EPINEPHRINE

Short Description: Injectable local anesthetic to help effectively aid in local area pain relief.

HAIR

FINASTERIDE/MINOXIDIL

Short Description: FINASTERIDE/MINOXIDIL effectively promotes hair regrowth, reduces hair loss, strengthens hair follicles, and improves scalp health for thicker, fuller, and healthier hair.

Long Description: Topical hair growth restoration Finasteride/Minoxidil topical preparation is a dynamic hair health solution aimed at combating hair loss and promoting hair regrowth. Finasteride works by targeting the hormonal root causes of hair thinning, reducing DHT levels, while Minoxidil enhances follicle activity and blood flow to the scalp, encouraging new growth. This powerful combination not only helps in restoring hair density and strength but also significantly improves scalp health. By addressing hair loss effectively, it boosts individuals' self-esteem and psychological well-being, contributing to a more positive self-image and overall quality of life through enhanced hair wellness.

PROGESTERONE/MINOXIDIL

Short Description: PROGESTERONE/MINOXIDIL enhances hair growth, reduces shedding, balances scalp health, and revitalizes hair follicles for visibly thicker, stronger, and more resilient hair.

Long Description: Topical hair growth restoration Progesterone/Minoxidil topical preparation is an innovative approach to hair health, specifically designed to combat hair loss and stimulate hair growth. Progesterone is believed to counteract the effects of DHT, a hormone implicated in hair thinning, while Minoxidil is renowned for its capacity to boost hair follicle activity and improve blood circulation to the scalp. This combination not only aims to halt hair loss but also encourages the regeneration of healthier, fuller hair. Enhancing hair vitality and appearance, it boosts self-confidence and contributes to emotional well-being, reflecting positively on overall wellness and quality of life.

FINASTERIDE (COMMERCIAL)

Short Description: FINASTERIDE targets hormonal causes of hair loss, significantly reducing hair fall and promoting regrowth for a fuller, healthier scalp and hair appearance.

FINASTERIDE/BIOTIN

Short Description: FINASTERIDE/BIOTIN combats hair loss at its root, encourages hair regrowth, strengthens strands, and nourishes the scalp for visibly fuller, healthier hair.

Long Description: Topical hair growth restoration Finasteride/Biotin preparation is a targeted solution for enhancing hair health, designed to address hair loss while simultaneously promoting hair strength and growth. Finasteride effectively reduces DHT levels, a key factor in hair thinning and loss, while Biotin, a vital vitamin for hair, supports the development of healthier, stronger hair strands by improving keratin infrastructure. This potent combination not only aids in preventing hair loss but also nurtures the scalp and hair follicles, leading to noticeable improvements in hair density and texture. Consequently, it bolsters self-esteem and mental wellness, significantly enriching one's life quality through improved hair vitality.

Upneeq (Oxymetolazine compounded)

Short Description: Oxymetazoline compounded offers a rejuvenated eye appearance, reducing under-eye bags and puffiness for a more youthful, lifted look with improved skin tone.

Long Description: Eye-lift without surgery. Oxymetolazine, when compounded for topical use, is explored for its potential in cosmetic dermatology, specifically for eye lift health improvement. Its vasoconstrictive properties can temporarily reduce under-eye bags and lift sagging skin around the eyes by tightening and reducing swelling. This application promotes a more youthful and refreshed appearance, enhancing facial aesthetics. The improvement in the eye area can boost self-esteem and emotional well-being, contributing positively to mental health. While primarily known for nasal decongestion, its cosmetic use underscores the versatility of Oxymetolazine in addressing both medical and aesthetic wellness concerns.

LATISSE (ALLERGAN)

Short Description: LATISSE® promotes fuller, longer, and darker eyelashes in just 16 weeks, enhancing natural beauty with clinically proven, FDA-approved treatment for inadequate lashes.

BIMATOPROST Lashes (Kit includes brushes & necessary instructions)

Short Description: Bimatoprost effectively enhances eyelash growth, offering thicker, longer, and darker lashes for a captivating look with consistent use, as demonstrated in clinical studies.

Long Description: Compounded lash growth serum. Bimatoprost, when compounded, is a powerful medication primarily used for enhancing eye health, specifically by treating conditions like glaucoma and ocular hypertension. Its mechanism involves increasing

the outflow of aqueous fluid from the eyes, effectively reducing intraocular pressure. This not only helps in preventing optic nerve damage but also preserves vision. Beyond its primary use, compounded Bimatoprost has gained popularity for its ability to stimulate eyelash growth, offering cosmetic benefits. By addressing both medical and aesthetic concerns, it contributes to improved physical health, boosts self-confidence, and enhances overall quality of life through better vision and appearance.

LATANOPROST

Short Description: Latanoprost, while primarily for glaucoma, unexpectedly promotes eyelash growth—yielding longer, fuller lashes as a secondary benefit with regular topical application.

Long Description: Compounded lash growth serum. Latanoprost, when compounded, is a highly effective medication for improving eye health, particularly in managing glaucoma and ocular hypertension. It works by increasing the outflow of aqueous humor from the eye, which helps in lowering intraocular pressure. This reduction in pressure is crucial for preventing optic nerve damage and preserving vision. Moreover, latanoprost has been noted for its ability to induce eyelash growth as a secondary effect, offering aesthetic benefits. Through its dual action, compounded latanoprost supports visual health and enhances personal appearance, contributing to both physical wellness and psychological well-being by improving self-image and confidence.

TOPICAL PAIN PREPARATIONS

DICLOFENAC/BUPIVACAINE

Short Description: Diclofenac/Bupivacaine offers powerful, dual-action relief for localized pain, reducing inflammation and numbing discomfort for extended comfort with topical application.

Long Description: Diclofenac/Bupivacaine compounded topical pain preparation is a specialized medication designed for targeted relief of acute and chronic pain. By combining Diclofenac, a potent anti-inflammatory, with Bupivacaine, a local anesthetic, this preparation offers immediate and sustained pain relief directly at the source. It's particularly effective in managing conditions like arthritis, sports injuries, and neuropathic pain. This dual-action approach not only alleviates pain but also reduces inflammation, enhancing mobility and overall functionality. Consequently, it supports physical wellness by enabling individuals to engage in daily activities with reduced discomfort, thereby improving quality of life and promoting active, healthy living.

GABAPENTIN/DICLOFENAC/BACLOFEN/CYCLOBENZAPRINE/BUPIVACAINE

Short Description: This potent blend provides comprehensive pain management—targeting inflammation, muscle spasms, and neuropathic pain for all-around relief with topical application.

Long Description: The Gabapentin/Diclofenac/Baclofen/Cyclobenzaprine/Bupivacaine compounded topical pain preparation is an advanced solution designed for comprehensive pain management. This robust formulation combines the nerve pain relief of Gabapentin, the anti-inflammatory properties of Diclofenac, the muscle relaxant effects of Baclofen and Cyclobenzaprine, with the local anesthetic benefits of Bupivacaine. Tailored for individuals suffering from complex pain syndromes, such as fibromyalgia or neuropathic pain, it offers targeted relief without systemic side effects. By addressing pain, inflammation, and muscle spasms simultaneously, this preparation significantly improves physical function, enhances mobility, and promotes overall wellness, enabling a more active and fulfilling lifestyle.

KETAMINE/GABAPENTIN/DICLOFENAC/BACLOFEN/CYCLOBENZAPRINE/BUPIVACAINE

Short Description:

Ketamine/Gabapentin/Diclofenac/Baclofen/Cyclobenzaprine/Bupivacaine offers

unmatched topical pain relief, addressing severe discomfort by targeting multiple pain pathways for immediate and sustained comfort.

Long Description: The

Ketamine/Gabapentin/Diclofenac/Baclofen/Cyclobenzaprine/Bupivacaine compounded topical pain preparation is an innovative and multifaceted approach to pain management. Incorporating Ketamine, known for its rapid analgesic effects on chronic and neuropathic pain, alongside Gabapentin, Diclofenac, Baclofen, Cyclobenzaprine, and Bupivacaine, this formulation delivers targeted relief directly to the affected areas. It's especially beneficial for individuals grappling with severe, multi-dimensional pain conditions, offering a synergistic effect that reduces pain, inflammation, and muscle spasms. This comprehensive treatment supports enhanced mobility, facilitates recovery, and improves overall quality of life, allowing patients to participate more fully in daily activities and regain a sense of wellness.

KETAMINE/GABAPENTIN/IMIPRAMINE/NIFEDIPINE/BUPIVACAINE/CLONIDINE

Short Description: Experience profound relief with

Ketamine/Gabapentin/Imipramine/Nifedipine/Bupivacaine/Clonidine, targeting chronic pain, enhancing circulation, and soothing nerves for all-encompassing topical comfort.

Long Description: The

Ketamine/Gabapentin/Imipramine/Nifedipine/Bupivacaine/Clonidine compounded topical pain preparation is a cutting-edge therapeutic solution designed to address severe and complex pain syndromes. By blending the analgesic properties of Ketamine, the neuropathic pain relief from Gabapentin, the antidepressant effects of Imipramine, the vasodilatory action of Nifedipine, along with the local anesthetic power of Bupivacaine and the alpha-agonist Clonidine, this formulation provides multifaceted pain management. It significantly aids in alleviating chronic pain, improving circulation, reducing inflammation, and minimizing muscle spasms. This comprehensive approach promotes enhanced physical function, fosters recovery, and supports overall wellness, enabling individuals to lead more active and satisfying lives.

ADDICTION TREATMENT

NALTREXONE INJECTION *1mL*

Short Description: Compounded Naltrexone Injection offers a promising approach to addiction treatment, curbing cravings and facilitating recovery with its long-lasting, targeted action.

Long Description: Affordable Compounded alternative Naltrexone injection, when compounded, serves as a pivotal treatment in addiction medicine, specifically targeting alcohol and opioid dependence. By blocking the euphoric effects of these substances, it significantly aids in reducing cravings and preventing relapse. This support is crucial for patients in recovery, facilitating a smoother path towards sobriety. Beyond its primary use, naltrexone has shown potential in managing chronic pain and certain autoimmune conditions, offering a broader spectrum of health benefits. Through aiding addiction recovery and potentially alleviating chronic conditions, compounded naltrexone injection contributes to improved physical health, mental well-being, and overall quality of life.
